

PROYECTO 12: Restringido la zona de texto () - Crear una zona de texto con cuenta de caracteres en vivo y un límite máximo de caracteres.

En este proyecto se le exige crear un área de texto que rastree y muestre el número de caracteres mecanografiados por el usuario, junto con un límite máximo de caracteres. Como los tipos de usuario, el conteo de caracteres se actualizará dinámicamente. Una vez alcanzado el límite, la zona de texto evitará una mayor entrada y la frontera se pondrá roja en indicar visualmente que el límite ha sido alcanzado.

The diagram illustrates three states of a text input field with a character count and a 250-character limit. Each state is represented by a rounded rectangle with a black border, except for the third state which has a red border.

- State 1:** The input field contains the placeholder text "Start typing ...". The character count "0 / 250" is displayed at the bottom right. A callout points to the count, stating: "Real-time counter and max char count allowed."
- State 2:** The input field contains the text "It should have a live character count. The number should increase based on what user types." The character count "91 / 250" is displayed at the bottom right. A callout points to the count, stating: "Character count should go up as the user keeps typing."
- State 3:** The input field contains the text "User should not be allowed to enter more than the maximum character count of 250. Upon hitting the maximum limit of 250, border of the textarea should turn red." The character count "250 / 250" is displayed at the bottom right. A callout points to the count, stating: "Upon hitting the text limit, stop the user from entering more characters and change the border color to red."

This project will help you practice manipulating input elements with JavaScript, handling user input events, and providing real-time feedback to enhance user experience.
