

PROYECTO 7: Formulario accesible IU (Accessible Form UI) - Crear un formulario accesible de la interfaz de usuario usando HTML y CSS.

En este proyecto, se requiere crear una interfaz de usuario de formulario utilizando sólo HTML y CSS. El formulario incluirá campos para un nombre completo, correo electrónico, contraseña y confirmación de la contraseña, junto con un botón para activar la visibilidad del texto de contraseña. Además, el formulario contará con una barra de progreso de la integridad y una lista de requisitos que deben cumplirse para que el formulario este completa al 100%. Si bien esta versión de la forma no será funcional, será un componente de interfaz de usuario estático que se puede mejorar con JavaScript en el futuro.

El objetivo de este proyecto no sólo es ayudarle a practicar su HTML y CSS, sino también centrarse en la creación de una forma accesible que sea fácil de usar para todos los usuarios, incluidas las personas con discapacidad. A continuación, se da la maqueta aproximada de la interfaz de usuario de formulario que necesitas para crear:

Accessibility Guidelines

You should read up on accessibility guidelines and best practices before starting this project. However, here are some key points to keep in mind while creating an accessible form UI:

Labeling: Ensure that each form field has a corresponding `<label>` element that is clearly associated with the field using the `for` attribute.

Focus State: Style the focus state of each input field so that users navigating with a keyboard can easily see which field is currently active.

Error Messaging: Consider adding space for error messages that can be displayed when a user inputs invalid data. These messages should be clearly associated with the relevant input field.

ARIA Attributes: Use ARIA (Accessible Rich Internet Applications) attributes where necessary, such as `aria-required` for required fields and `aria-invalid` for fields with errors.

Color Contrast: Ensure that the color contrast between text and background is sufficient to meet WCAG (Web Content Accessibility Guidelines) standards, making the form readable for users with visual impairments.

Interactive Elements: Make sure that the button to show/hide the password is accessible via keyboard and screen readers, providing clear feedback on the current state (e.g., “Password is hidden” or “Password is visible”).

Once done, you can test the form UI using a screen reader or browser extensions like Axe or Lighthouse to check for accessibility issues and make necessary adjustments.

After completing this project, you will have a solid foundation in creating accessible and well-structured forms using HTML and CSS. You can later enhance this form by adding JavaScript to make it fully functional and dynamic in future projects.
